

Wichita TMC Support- Monthly Incident Report for July 2013

There were a total of 190 actively logged incidents, with **88** incidents along the **US-54** corridor, **22** occurred along **K-96**, **65** along **I-135**, **14** on **I-235** and **1** on **K-254**. Any congestion incidents that were logged by the MIST system without additional operator information were excluded from the analysis. Below is a breakdown of active incident type as well as average duration of incident by type.

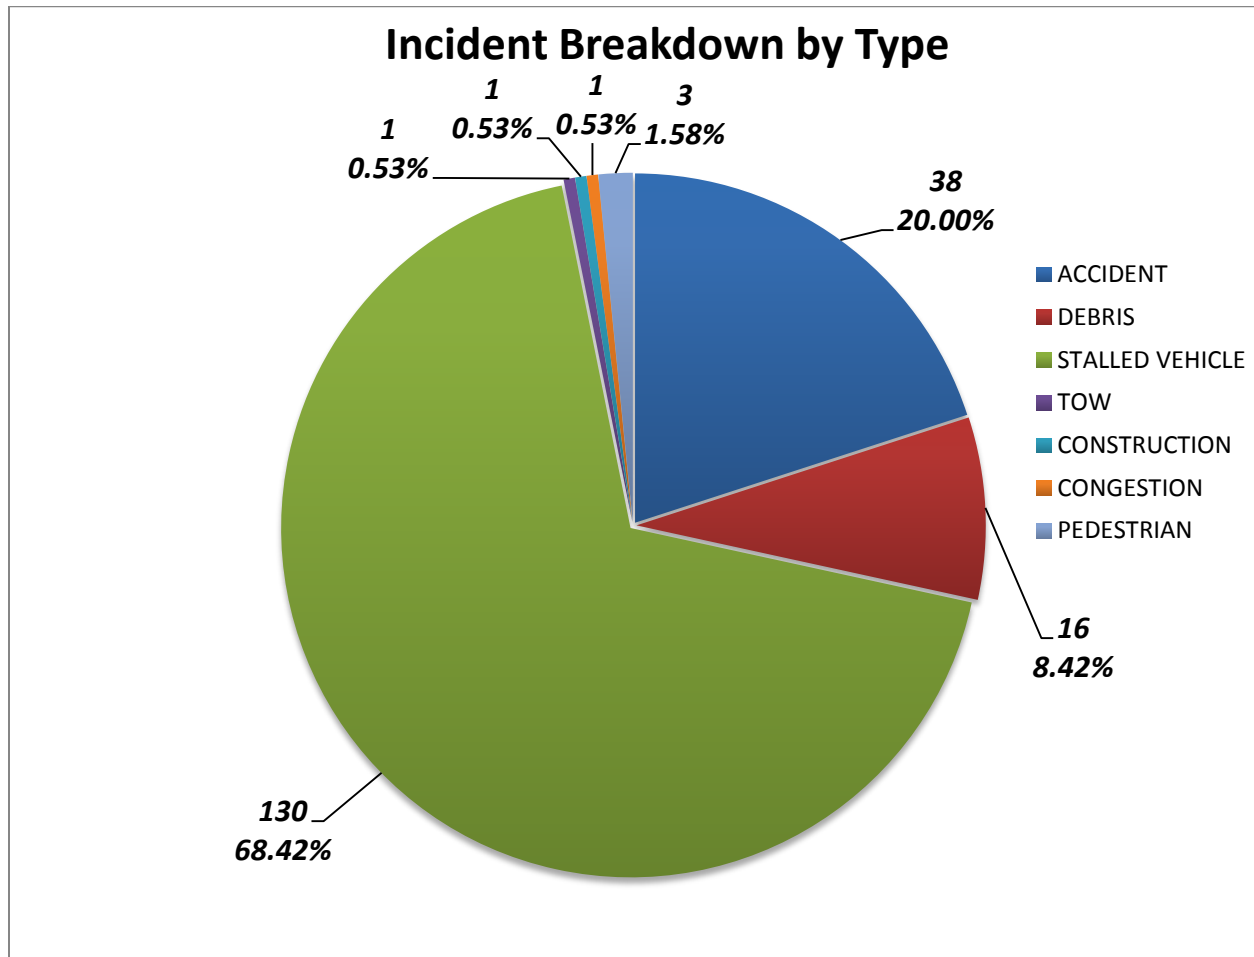

Figure 1: Number and percentage of actively logged incidents in MIST for the month of July broken out by type of incident.

¹ Four (4) logged accidents are excluded from the information due to unreliable information. The accidents were initially logged on Friday, July 19 and terminated Monday, July 22. The event durations are not consistent with any known accidents, and therefore removed from the information presented below. Probable source of error was an operator leaving an accident open Friday night and the accident not terminating until the arrival of the next operator on Monday morning.
